

St. Andrew's Mansions, Central London

The installation at St. Andrew's Mansions was extremely neat and tidy, with all cabling well fixed and run in clean straight lines. Residents were able to benefit from the hyperfast connection only 3 months after the installation proposal was approved.

The high-end apartments at St. Andrew's Mansion were suffering from poor broadband speeds, which was reducing the property value. As it's a period building, the property managers didn't want a messy or intrusive install that would spoil the aesthetics of the building.

We met with the directors of the building to discuss install options. External cabling was the most

suitable option to complete the project, and after seeing examples of previous Hyperoptic work, the install process was approved.

In order to complete the project, an approved abseiling partner of Hyperoptic was used to install the cabling in the safest and tidiest way.

Building type

- Private residential
- 31 units

External view of development

Cabling from roof to external walls

"I was impressed with the installation. They were sensitive to the aesthetic requirements of installing cables in an old block in a conservation area and were straightforward to deal with."

External cabling concealed behind pipes

Cabinet located on the roof of the development with neat cabling
